

## READ ME

This software has been provided to you free of charge. You may freely distribute this software to anyone you think it may help. My only stipulation is that you do not charge for this application. It must remain free.

How to use Meta Snatcher:

1. Open the MetaSnatcher.jar file contained within this folder.
2. Enter the key phrase or word you wish to research.
3. Choose the number of results you wish to query from Google, by using the horizontal slider.
4. Press to snatch keywords button

Depending on your Internet connection speed and the number of results this may take a few seconds or a few minutes. The software scrapes the top ranked websites for their keywords and displays a graph of the most popular related terms. This is extremely useful when trying to come up with alternate key phrases for your projects.

Thanks!
